AutoCAD uses a coordinate system defined by three orthogonal axes – X, Y and Z – and a space (or position) of origin. Although the position of the X, Y and Z axes are usually defined in terms of true length, e.g., in meters, you can set them in the same units as the coordinates of other entities in your drawing. However, the position of the origin is not bound by any physical scale, unlike the position of the X, Y and Z axes, and the number of feet, meters, and centimeters you use is purely an internal matter. A set of dimension lines for an element are referred to as a Dimension Style. An AutoCAD Dimension style is one of the elements in a drawing which you can apply to any dimension line you create (though you may also apply a Dimension Style to an annotation). A Dimension Style combines your choice of Units and a specific text placement, but does not affect the Dimensions Points used for the dimension. Dimension Styles are designed to be applied uniformly to all Dimension lines at once. For example, if you selected the Meter as your Unit for all of your dimension lines in a drawing, you can use the same Dimension Style to set the text placement and the default for all your Dimension lines at once. However, you can still use a different Dimension Style for each individual Dimension line. You can apply a Dimension Style to multiple Dimension lines at once. This is especially useful when you want to set a single value for all Dimension lines of a certain type. For example, if you apply a Scale Style to a large number of linear dimension lines, you can apply the same text placement, just change the scale, to all the dimension lines of that type. The Units are applied to a Dimension Style by a set of numeric fields (values) within a Style Element which hold the values in the units defined in the Style Elements Units field. The style Element Unit_of_Measure is the one that holds the Unit for a Dimension Style. However, the “standard” dimension line (Dimension) uses the Component field of the Component Style. Each Dimension Style can have its own Dimension Size. The Dimension Size is a numeric value in the Units field that overrides the Dimension Length. This allows you to change the default length of your Dimension lines. When you change the default Dimension Size, the Dimension Line’s Units field is updated. So you have a choice in terms of where to

I have this code that populates the form and then uses Regex to validate the form: var text = textBox1.Text; var text1 = textBox2.Text; var text2 = textBox3.Text; var text3 = textBox4.Text; var text4 = textBox5.Text; var text5 = textBox6.Text; var regex = new Regex(@"^\s*[a-zA-Z0-9]{1,}.*\$"); if (regex.IsMatch(text) || regex.IsMatch(text1) || regex.IsMatch(text2) || regex.IsMatch(text3) || regex.IsMatch(text4) || regex.IsMatch(text5)) { MessageBox.Show("Please enter the correct text"); } else { textBox1.Text = text; textBox2.Text = text1; textBox3.Text = text2; textBox4.Text = text3; textBox5.Text = text4; textBox6.Text = text5; } The problem with this is that I have to copy this code 6 times (textBox1 to textBox6) to check if each field is empty. It'd be great if I could do something like: var text = textBox1.Text; var text1 = a1d647c40b
