For instance, this command uses the default "beach" icon that's available in the distribution: convert ice.png beach.png And there's also a set of canned icons available from the foobar2000 site that you can use. [Relative effect of newborn hypoxia and resuscitation on the development of the antioxidant system in rat lungs]. The effect of fetal hypoxia and its treatment on antioxidant system development was studied in rat lungs from day 2 to day 14 of postnatal life. Hypoxia was induced on day 14 of gestation in rats by reducing oxygen concentrations in the air. Control animals breathed oxygen. Antioxidant status was assessed by measurement of the activities of antioxidant enzymes (superoxide dismutase and catalase) and antioxidant compounds (alpha-tocopherol and reduced glutathione). The results suggest that newborn hypoxia induces a state of antioxidant system imbalance, which depends on the degree of hypoxia and duration of fetal hypoxia, leading to increased susceptibility of the antioxidant system to the prooxidant action of oxygen. The reduction of antioxidant enzymes and antioxidant compounds induced by hypoxia in newborn rats is associated with a decrease in the level of tocopherol and in the activity of glutathione reductase, suggesting a reduced activity of the cellular antioxidant system. As a result of resuscitation from asphyxia in newborn animals, there is a normalization of antioxidant system in the lungs of 21-day-old animals. This effect is associated with a normalization of tocopherol content and the activity of glutathione reductase.Kinetic and theoretical aspects of the catalyst function of a manganese porphyrin bound to carbon nanoparticles. The catalytic activity of a manganese porphyrin bound to carbon nanoparticles has been studied by means of a fast kinetic spectrophotometric method. The temperature effect and the reactivity of the catalyzed hydrogen-evolution reaction has been studied. A rigorous treatment of the kinetic equations has shown that the limiting step of the reaction is the formation of a reactive intermediate, which reacts rapidly with H2 to produce methane. Moreover, the temperature dependence of the reaction rate constant suggests that the intermediate should be a species of transition state.924 F.2d 1053Un
