This is particularly true in the dairy industry, where these microorganisms can impact cheese quality and milk components. Cheese-ripening is the process whereby certain bacteria transform milk or milk products to ripened cheese. The process by which milk develops into cheese involves several complex biochemical and microbiological reactions. After the

bulk portion of the milk has been coagulated, lactic acid bacteria (LAB) present in the milk induce a variety of chemical changes. Some of these changes, e.g., the formation of exopolysaccharides and diacetyl, contribute to the characteristic flavor and aroma of cheese, while others affect flavor and quality. Lactobacilli and other bacteria may inactivate the enzymes that would otherwise make the cheese curd. The development of

cheese is highly dependent upon the activity of the specific LAB present in the milk in order to form a firm curd that will keep the cheese from separating into layers. Proper ripening is important for the initial taste of cheese, as well as for the texture of the finished cheese product. The major determinants of whether a particular cheese is considered “ripe” or “mature” are a subjective evaluation of the consumer. The ideal for cheese is that

the cheese becomes increasingly more aromatic, flavorful, and complex in flavor and texture, rather than reaching a uniform maturity level. It is accepted that the bacteria that carry out the ripening process develop at different rates and degrees as cheese ripens. Therefore, the length of time needed to ripen the cheese is not uniform. The total fermentation or ripening time, depending upon where the cheese is made, can range from about one week

in the tropics to many months in cooler climates. This delay in ripening, coupled with the fact that cheese is typically ripened for only a short time, makes it difficult to devise a method to predict or control the length of the ripening process. It is generally accepted that approximately 9 billion LAB and lactic acid bacteria need to be present in the milk in order to produce an edible cheese. However, a high population of bacteria does not
