The Free Image Editing Software There are a variety of free, graphic-design–related image-editing programs available online. Some are very basic, such as the original version of Paint Shop Pro introduced in 1985, while others like Photoshop are rather sophisticated. However, many of the programs offer valuable tools that significantly extend the capabilities of Photoshop. I've tried a few on my own, and I've found them to be useful alternatives. In many cases, simply running these programs in a trial mode is sufficient, although many offer a thirty-day free trial. Once you've downloaded the program, you can purchase additional time to use it.

As a long-time photoshop editor I always say that anyone can learn Photoshop and I do not care which version you are more comfortable with, because both are pretty similar from the user interface. The main differences between PS Elements and Photoshop (PS) are: Elements is designed for photographers with little or no experience Photoshop is designed for photographers with no photography experience If you go deep into the user interface of Photoshop, there is a lot of differences that at first glance look very technical. Not to worry, I will try to keep this short and simple. In the following paragraphs I will explain each of the different categories of features in PS and in Photoshop. Tools If you want a list of all the tools available in Photoshop, check here. For Elements you have the option to use everything Photoshop or only the tools that a beginner needs. On of the top features of Elements is that it has fewer tools than Photoshop. The main difference is between the darkroom and the digital darkroom. Darkroom is a term used to describe having no distractions, focused on the only tool you use to get the job done. The reason for the “no distractions” is to focus on what you are doing. It is more like in video editing; you have no task managers, you do not check your email or social media for updates and your work is the priority. TIP: Good if you do not use an external light source it is best to work in natural light so you can use the light that you have available. Try to get as little noise as possible or if you are using an external light try to get it as small as possible. In Photoshop you have a lot of buttons and menus that can take you away from what you are doing. While in Photoshop you can follow it by using the Smart Objects (Saving Smart Objects), which are used for navigation and resizing the image. PS Elements have the image editing tools that you need to make your picture look like the one that you want it to look like. Menus Photoshop has a lot of menus, which are also very similar in PS Elements. The reason why I did not make an “Saving Photoshop” tutorial is because it is much easier to navigate Photoshop than to navigate Photoshop Elements. Photoshop/PS elements has the following main menus: Home: the beginning of the editing process
