The Reviewer: Kazimierz Gluzinski (Home: Poland) Rivalry Games Online is a free multiplayer game that lets you fight some epic online fights

with your friends. Check out this game for free in your computer. Browsing the net with a horse age simulator? The freeware program involves NASCAR Racing Simulation and lets you race with your friends and family via online.

Q: How to calculate time for 2 events with dplyr? I have a data set which has many repeated events. I want to calculate the time of the 1st event and the last event of the same event_id. I want to get the mean between the event times.

```
library(plyr) set.seed(1) df =  
data.frame(event_id = c(1, 1, 1, 1, 2, 2, 2, 2,  
3, 3, 3, 3), event_time = c(26:29))
```

With base package I could do this with the following code: `df %>% group_by(event_id) %>% summarise(first_time = max(event_time))` which is good, but I want to use dplyr. I have tried the following: `df %>% group_by(event_id) %>%`

summarise(first_time = tapply(event_time,
event_id, max)) but it doesn't work and
generates the following error message: Error:
